ABSTRACT

This report, Part I of a three-part study, provides information on the demographic and program characteristics of families who received assistance payments in May, 1975, under the Aid to Families with Dependent Children (AFDC) program, including the unemployed father segment. The data were derived from a sample survey which included all states and jurisdictions except Guam. The minimum sample required from each state was one-half of one percent, but states were given the option to submit larger samples computed by specified formulas. Twenty-nine states provided samples large enough for reliable state data to be included in the tabulations. Data are also shown for all 10 Health, Education and Welfare (HEW) regions. Sample data are inflated to represent all families receiving money payments during the study month. Therefore, the data are subject to sampling variability and, as in all surveys, the figures are subject to errors of response. A brief overview of AFDC in 1975 and changes since 1973 prefaces the 47 tables included in the report. Major categories of data are Assistance History, AFDC Family and Household, Children in the AFDC Family, Mothers of AFDC Children and Fathers of AFDC children. Appendices provide a glossary of selected terms and a discussion of sample design and of data accuracy. (Author/RH)

NOTICE

Under a recent reorganization within the Department of Health, Education, and Welfare, the program of aid to families with dependent children became a part of the Social Security Administration.

FOREWORD

This report provides information on the demographic and program characteristics of families who received assistance payments in May 1975 under the AFDC program, including the unemployed father segment. Subsequent reports will provide data on child support enforcement, financial circumstances, and types of services received.

The study was planned and carried out by the National Center for Social Statistics of the Social and Rehabilitation Service prior to the reorganization of HEW which was announced in March 1977. The study was directed by Howard Oberheu of the Family Assistance Studies Staff. The sample was designed by William Hickey and Stanley Nachimson, mathematical statisticians, presently of the Office of Human Development Services. Computer programs for the editing and tabulation of the data were prepared under the direction of Bernard Silverstein; he was assisted by Janice Sigurdson and Virginia Battle presently of the Health Care Financing Administration.

The data were derived from a sample survey which included all States and jurisdictions except Guam. The minimum sample required from each State was one-half of 1 percent, but States were given the option of submitting larger samples computed by specified formulas. Twenty-nine States provided samples large enough for reliable State data to be shown in the tabulations. Data are also shown for all 10 HEW regions. Sample data are inflated to represent all families receiving money payments during the study month. Therefore, the data are subject to sampling variability and, as in all surveys, the figures are subject to errors of response.

The Office of Research and Statistics gratefully acknowledges the cooperation of all State and local welfare agency personnel who provided the information needed for the study. State welfare agencies were responsible for completion of sample surveys for the study month. Information was obtained from case records supplemented by the personal knowledge of welfare agency workers.

John J. Carroll
Assistant Commissioner for
Research and Statistics

September 1977

AFDC IN 1975 AND CHANGES SINCE 1973

ASSISTANCE HISTORY

The proportion of families who had received assistance for 5 to 10 years increased. These families began receiving AFDC in the late 1960's when caseload growth was greater than now. The proportion of families who had received AFDC for 18 months or less through the study month decreased from 40.8 percent to 36.3 percent since 1973. 1/ A decline in new cases means relatively fewer families in the short-term categories of time on assistance. The total number of AFDC families increased by two-thirds during 1969-70, by 21 percent during 1971-72, and 8 percent during 1973-74. About one-fourth of the families in 1975 had received AFDC before their current time on assistance.

In 1975, almost two-thirds of the families experienced a change in income or resources resulting in the most recent opening of the case for AFDC. Of these case openings, half were the direct result of the father's leaving home and stopping or reducing financial support. The father who had not been in the home for some time but who recently stopped or reduced support accounted for 10 percent of these families. Two out of 5 families who experienced no recent change in their financial situation had been living below the agency standards but for some reason had not received assistance.

AFDC FAMILY AND HOUSEHOLD

The percentage of small-size families increased. The proportion of AFDC families with one child increased from 33.8 percent to 37.9 percent between 1973 and 1975. The proportion with two children or three children remained constant, about 26 percent and 16 percent, respectively. The average size of the families decreased from 3.6 to 3.3 persons.

The proportion of families living in metropolitan areas remained the same. However, the concentration of AFDC families shifted from cities of 1 million or more population to smaller cities. In both 1973 and 1975, nearly 4 in 5 families lived in metropolitan areas. Families in the six largest cities--Chicago, Detroit, Houston, Los Angeles, New York and Philadelphia--each with 1 million or more, decreased from 20.5 percent to 18.8 percent.

1/ See Findings of the 1973 AFDC Study, Part I, Demographic and Program Characteristics, U.S. Department of Health, Education, and Welfare, DHEW Publication No. (SRS) 74-03764, NCSS Report AFDC-1 (73), June 1974. The study month was January in 1973 and May in 1975.

Most families lived in private housing, but the families living in public housing increased from 13.6 percent to 14.6 percent. In 1975, 75.3 percent of families rented either public or private housing, and 12.2 percent lived in a home owned by a member of the AFDC family. About 8 percent had an arrangement for rent-free living quarters.

The proportion of white families receiving AFDC rose from 46.9 percent to 50.2 percent. The proportion of black families decreased slightly to 44.3 percent. The proportion of those of Spanish origin or descent and American Indians remained about the same. Although reported separately, race and Spanish ethnicity are combined in the 1975 figures that follow:

	Percent of families
Black......................	44.3
American Indian............	1.1
Asian......................	.5
Spanish 1/.................	12.2
White, other than Spanish..	39.9
Other and unknown..........	2.0

1/ Includes persons whose race was reported as white, other, and unknown.

Households headed by a woman increased from three-fourths of all AFDC families to four-fifths. Most of the women were natural or adoptive mothers or stepmothers of the AFDC children. In March 1975, about 13 percent of all families in the United States were headed by women. 2/

AFDC CHILDREN

In both 1973 and 1975, nearly a third of all AFDC child recipients had parents who were not married to one another. The proportion increased for children with divorced parents from 17.7 percent to 19.4 percent while for those with separated parents it remained constant at about 29 percent. The proportion of children with incapacitated fathers decreased from 10.2 percent to 7.7 percent. Small percentages of children received AFDC because their fathers were absent for other than above reasons or because their fathers were deceased or unemployed. A few of the children were deprived of the support or care of a mother but not a father. (Children are eligible for AFDC when they have been deprived of parental support or care by reason of a parent's death, continued absence from the home, or physical or mental incapacity. In May 1975, 24 States exercised the option of providing assistance to children whose fathers were unemployed, as defined in Federal regulations.)

2/ Bureau of the Census, Current Population Reports (Series P-20, No. 291), February 1976.

In both years, about one-fourth of the children were in multifather families. Relatively few families had children with different mothers.

The age distribution of AFDC children changed little. In both years, about one-third of the AFDC children were under age 6. The proportion of families with the youngest child aged 1 or 2 decreased from 36.4 to 32.6 percent. The proportion of families whose youngest child was aged 3, 4, or 5 increased, from 22.8 percent to 24.9 percent. Boys slightly outnumbered girls among AFDC children in 1975.

Most school-age AFDC children attended school; some worked to increase the family income. Children aged 18-20 who receive AFDC must regularly attend school or a course of vocational or technical training designed to prepare them for gainful employment. Twelve States did not provide assistance to children over age 17. The following tabulation indicates the percentages of AFDC children in school and employed at various ages:

Age	Enrolled in school		Employed	
	1973	1975	1973	1975
5-11	1/96.5	89.8	N/A	N/A
12-15	97.4	97.8	2/1.0	2/1.4
16-17	91.2	89.6	3.2	4.2
18-20	87.1	88.2	6.6	6.6

1/ Aged 6-11.
2/ Aged 14-15.

MOTHERS IN THE HOME

In 1975, 91.1 percent of all AFDC families had a natural or adoptive mother in the home.

Most mothers were AFDC recipients. Over 9 in 10 in both 1973 and 1975 were included with the children in the AFDC money grant. Few mothers received assistance for the disabled, including blind, under the supplemental security income program or general assistance. About 6 percent received no public assistance--in some cases because of support by a stepfather in the home.

Over 1 in 4 of the mothers was in the labor force. Sixteen percent were employed, 9 percent were actively seeking work and 1 percent were awaiting recall from layoff. About half the mothers were needed as full-time homemakers or were incapacitated. Of the remaining 1 in 5 mothers, about half were registered for the work incentive (WIN) program and many of the others were exempted from WIN.

Service work predominated among the mothers. The usual occupation of nearly 1 in 4 mothers was service work. For a majority of the women this work was not in private households but in other types of service jobs, such as waitress or beautician.

More of the mothers were under age 30 in 1975. For this age group, the proportion rose from 49.5 percent to 51.4 percent. One in 10 of the mothers was aged 45 or over.

Over 1 in 4 of the mothers had graduated from high school. Only 4.6 percent had attended college. About 10 percent of the mothers had not completed the eighth grade.

FATHERS IN THE HOME

In 1975, 10 percent of all AFDC families had a natural or adoptive father or legally responsible stepfather in the home.

Relatively fewer fathers received AFDC. The proportion of fathers receiving such payments decreased from 81 percent to 73 percent. About 15 percent received assistance for the aged and disabled (including the blind) in both years.

Incapacity of the father was less frequent than in 1973. The proportion of fathers incapacitated for employment decreased from 53.8 percent to 47.3 percent. One in 8 fathers was employed. Of the employed fathers, two-thirds worked fulltime and thus received no AFDC. One in 4 fathers was actively seeking work or awaiting recall from layoff.

Blue-collar work was predominant among the fathers. The usual occupation of 54.5 percent of the fathers was some type of blue-collar work, such as craftsman, operative, or laborer. Over half of those in blue-collar work had been or were employed as laborers. Almost all of the fathers had worked at some time.

Over a third of the fathers were aged 45 and older. The proportion of young fathers, those under age 30, increased from 22 percent to 24 percent since 1973. Only 1.6 percent were teenage fathers.

One-third of the fathers had not gone beyond eighth grade. A slightly larger group had attended high school or graduated. College studies were begun by 3.2 percent. The educational level was not known for about one-fourth of the fathers.

APPENDIX A--GLOSSARY OF SELECTED TERMS

Aid to families with dependent children (AFDC). As used in this report, AFDC means money payments with respect to a dependent child or children and includes money payments to meet the needs of the parent(s) or needy relative with whom the child is living and the needs of any other individual living in the same home who is considered essential to the well-being of the child if the resources and the needs of such individual are taken into account in determining the amount of the money payment.

Dependent child. For AFDC, this term means a needy child who has been deprived of parental support or care by reason of the death, continued absence from the home, or physical or mental incapacity of a parent, or, at the option of the States, who is deprived of such support or care because the father is unemployed as defined in Federal regulations. The needy child must be living with his father, mother, grandfather, grandmother, brother, sister, stepfather, stepmother, stepbrother, stepsister, uncle, aunt, first cousin, nephew, or niece (including such relatives of the half-blood; preceding generations as denoted by prefixes of grand, great, or great-great; and persons who have legally adopted the child or his parents) in a place of residence maintained by one or more of such relatives as his or their own home. The child must be under age 18; or, at the option of the States, 18 years of age but under 21 and a student regularly attending a school, college, university, or a course of vocational or technical training designed to fit the child for gainful employment.

Child recipient. Each dependent child who meets the above criteria is a child recipient. In some States this term includes the unborn child when pregnancy has been medically determined.

Adult recipient. An adult recipient is a needy relative with whom a dependent child is living and whose needs are taken into account in determining the amount of the AFDC money payment. If the parent of at least one of the children is incapacitated, or the father of one of the children is unemployed, the spouse of such parent may also be an adult recipient if the State so elects.

AFDC assistance group. The AFDC assistance group consists of the dependent children (child recipients) as defined above, the adult recipients as defined above, and any other individual living in the same home who is considered essential to the well-being of the child and whose resources and needs are taken into account in determining the amount of the AFDC money payment.

AFDC family. As used in this report, the AFDC family is synonymous with the AFDC assistance group. Other persons related to members of the assistance group may live in the same household. Thus, the AFDC family will sometimes differ from the "family" as it is usually defined. The most commonly used definition of a family is that of the U. S. Bureau of the Census: two or more persons related by blood, marriage, or adoption who reside together.

Household. 1/ A household consists of all persons who occupy a housing unit. A housing unit is defined as a group of rooms or a single room occupied as separate living quarters, that is, when the occupants do not live and eat with any other persons in the structure and when there is either (a) direct access outside the building or through a common hall or (b) complete kitchen facilities for the exclusive use of the occupants of the household.

Group quarters. 1/ Group quarters include all living arrangements other than households. Included are institutions and separate living quarters such as rooming and boarding houses in which there are five or more persons unrelated to the head or, if there is no head, six or more unrelated persons in the unit.

Head of household. Caseworkers were asked, "Who is the head of the household?" Reply categories were those shown in table 15. Caseworkers were instructed that the head of the household is the person who is regarded as the head by the members of the household. They were also instructed that the head did not have to be a member of the assistance group.

Race of payee. Caseworkers were asked, "What is the race of payee: white, Negro or black, American Indian, or other (races)?" They were instructed that if there was any doubt as to how the person's race should properly be classified, the decision should be based on their own judgment of the community appraisal of the person's race.

Spanish origin or descent of payee. Caseworkers were asked, "Is payee's origin or descent: Mexican; Puerto Rican; Cuban; other Spanish; no, none of these?" They were instructed that in all cases, including those of mixed origin or descent. the community appraisal of the person should be the determining factor in answering the question. For the category "other Spanish," they were instructed to consider such characteristics as Spanish surname, use of Spanish as the mother tongue, and place of birth.

1/ As defined by the Bureau of the Census, U. S. Department of Commerce.

SMSA. 2/ Except in New England, a standard metropolitan statistical area is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county or counties containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities, rather than counties.

Central cities. 2/ The population inside SMSA's is further classified as "inside central cities" and "outside central cities." With a few exceptions, central cities are determined according to the following criteria:

1. The largest city in an SMSA is always a central city.
2. One or two additional cities may be secondary central cities on the basis and in the order of the following criteria:
    a. The additional city or cities have at least 50,000 inhabitants.
    b. The additional city or cities have a population of one-third or more of that of the largest city and a minimum population of 25,000.

Employed, full and part time. Full-time employment was defined as work for 35 hours or more per week, and part-time employment was defined as work for less than 35 hours per week. Caseworkers reported on the employment status of the person during the study month.

Usual occupation. Caseworkers were asked, "What is the usual occupational group of the (father)(mother)? " Reply categories were those shown in tables 36 and 47. Caseworkers were given a detailed listing of types of work to use as a guide in classifying the work of the person. They were instructed that usual occupation was to be defined as the type of work in which the person had been employed for most of the person's working life. Employment may have been either full or part time, on a regular or intermittent basis, including seasonal employment. When there was more than one usual kind of work, the principal occupation was to be selected, e.g., a full-time skilled toolmaker who also operated a small farm of his own was to be reported as "toolmaker." When there were several kinds of work of equal importance, the most recent work was to be reported.

2/ As defined by the Statistical Policy Division, Office of Management and Budget, Executive Office of the President.

APPENDIX B--SAMPLE DESIGN AND ACCURACY OF DATA

DESIGN CONSIDERATIONS

The sample for the 1975 AFDC Study was designed to be representative of the May 1975 caseload. In addition, the sample was stratified to allow for a longitudinal analysis of the AFDC caseload and to check the accuracy of reporting. For the longitudinal strata, the sample included cases that were used in the 1973 AFDC Study sample that also received AFDC in May 1975. For the accuracy check, the sample included cases from the May 1975 AFDC quality control sample. Additional cases were used for the 1975 AFDC Study that were neither in the 1973 sample nor the quality control sample.

To obtain the longitudinal strata sample, an attempt was made to equalize a State's 1973 and 1975 sampling rate. If the 1973 sampling rate was higher than the 1975 rate, the 1973 cases were subsampled down to the 1975 rate. If the 1973 sampling rate was lower, the 1973 cases were supplemented by cases drawn in 1975 which received a payment in 1973. Different weights for each stratum were assigned to compensate for differences in the sampling rates.

The first step in the weighting process was to estimate the stratum population in each State. The proportion of cases in each stratum was estimated by the sample proportion of cases drawn entirely from the 1975 caseload that were in each stratum. The total AFDC universe was then multiplied by these proportions, resulting in an estimate of population totals in each stratum. Stratum weights were then calculated by dividing the population estimates in a stratum by the number of sample cases in a stratum.

STATE SAMPLE SIZES

States had the option of using either a minimum sample size (1.3% of the AFDC caseload in Region VIII; 1% in Region X; .6% in Region VII; and .5% elsewhere) or an increased sample size sufficiently large to estimate a characteristic occurring at the one-half or one percent level in the State AFDC population with a standard error of 0.25 percent. The sample size was calculated using the formula:

sample size = N/(1 + (.00116879 x N)), where N is the caseload size.

TABLE A-1.--Number of families and sample size

State	Universe	Sample size	State	Universe	Sample size
Alabama	50,556	252	Nebraska	11,464	72
Alaska	3,916	39	Nevada	4,400	12
Arizona	20,790	852	New Hampshire	8,030	60

Missouri	85,507	840	Wyoming	2,305	28
Montana	7,136	94			

SAMPLING VARIABILITY

The figures in the attached tables are based on a sample of AFDC families and are, therefore, subject to sampling variability. They may differ from the results that would have been obtained by a complete census. However, because the research design involved a known probability of selection for a given family, the sampling variability can be estimated. The following tables indicate the estimated sampling variability (or standard error) of various percentages and absolute numbers contained in the tables in this release.

About 2 out of 3 of all possible probability samples selected, with the same specifications, will yield estimates within one standard error of the figures that would have been obtained in a complete count of AFDC families. About 95 percent of all such probability samples will give estimates within 2 standard errors, and about 99 percent of all possible probability samples will give estimates within 2.5 standard errors of the "true" figure.

TABLE A-2.--Approximate standard error of estimated percentage of AFDC families for the U.S. 1/

Estimated percentage	Standard error	Estimated percentage	Standard error	Estimated percentage	Standard error	Estimated percentage	Standard error	Estimated percentage	Standard error
1.........	0.08	11.........	0.24	21.........	0.31	31.........	0.35	41.........	0.38
2.........	.11	12.........	.25	22.........	.32	32.........	.36	42.........	.38
3.........	.13	13.........	.26	23.........	.32	33.........	.36	43.........	.38

10.........	.23	20.........	.31	30.........	.35	40.........	.37	50.........	.38

1/ For percentages (p) greater than 50, the standard error is equal to the standard error of 100-p.

Approximate standard error for populations other than U.S. total families

For any U.S. population, multiply the approximate standard error of the value for families by the factor for that population as shown in the following table:

Table A-3 Population Factor

Population	Factor
Mothers	1.0
Fathers	3.0
Other adults	2.5
All adults in home	1.0
All children	1.0
Recipient children	1.0
Nonrecipient children	3.0

For any State and regional population, multiply the approximate standard error for the U.S. population by the factor for the State or region as shown in the following table:

Table A-4 State and Region Factor

Area	Factor
State	5.0
Region I	4.0
Region II	2.5
Region III	3.0
Region IV	2.6
Region V	2.2
Region VI	3.6
Region VII	4.2
Region VIII	4.2
Region IX	2.7
Region X	4.2

For example, an estimate of 25% for families has a standard error of .33%. For U.S. fathers, an estimate of 25% has a standard error of .99% (.33 x 3) from table A-2 and A-3. For Region I recipient children, an estimate of 25% has an approximate standard error of 1.3% (.33 x 1 x 4), from tables A-2, A-3, and A-4.

Approximate standard error for subuniverse characteristics

Several tables concern subuniverse tabulations of portions of the total universe (e.g., families receiving food stamps is a subuniverse of all families). To obtain the approximate standard error of subuniverse percentage values, multiply the subuniverse percentage value of the universe by the subuniverse characteristic percentage value. Then use the tables to determine the standard error of the product, treating the product as a percentage value of a universe characteristic. Using families that previously received AFDC prior to the current opening in California as an example, 28.8% of all families in California previously received AFDC (subuniverse percentage value of the universe) and 20.8% of families that previously received AFDC did so for 1-6 months (subuniverse characteristic percentage value). Following the instructions, 28.8% x 20.8% = 6.0%. The standard error of a State family percentage of 6.0% is .18% (from table A-2) x 5 (from table A-4) = .9%; thus the standard error of 20.8% is 20.8 / 6.0 x .9 = 3.12%

Approximate standard error of estimated numbers

To obtain the standard error of the estimated number of a population with a specific characteristic, the standard error of the percentage for that characteristic should be multiplied by the total number in the population.

For example, in a State with a population of 25,000 cases, a percentage figure of 10% represents 2500 cases. The 10% has a standard error of 1.25%, the 2500 has a standard error of 312.5 (25,000 x 1.25%).

Significant differences (x = .05) between U.S. and Region or States or between Regions and States for caseload percentage estimates

The standard errors and intervals in the technical appendix tables are based on sample sizes of one-half of one percent (17,098 families) of the U.S. total of AFDC families in May 1975 and approximately 860 AFDC families per region or State, the minimum required for publication of the data. Since the actual sample for the U.S. and some regions and States is larger, these standard errors and intervals are generally over-estimated.

Figures in the tables refer only to percentage estimates for total caseloads. The estimated percentage in column 1 of each table is for a given characteristic in a caseload (U.S. totals in table A-5, State or region totals in table A-6). Columns 2 and 3 show the nearest upper and lower percentage values at which differences between the characteristic in this population and in another population become statistically significant (i.e., we are 95 percent confident that the true difference is greater than zero).

For example, a State's percentage for a characteristic is 28 percent. The U.S. estimate for this characteristic is 30 percent. Looking at table A-5, we see that the figures which are significantly different from 30 are 33.3 percent and 26.9 percent. Since 28 percent is between these figures, we can conclude that it is not significantly different from 30 percent.

To compare other States or regions to a specified State, we use table A-6, and the row for 28 percent. Percentages significantly different from 28 percent are less than or equal to 23.8 percent and equal to or greater than 32.4 percent. A State or regional percentage for the characteristic between 23.8 percent and 32.4 percent is not significantly different from the 28 for the specified State.

These tables were derived as follows:

The standard error of the difference between two independent estimates, P_1 of P_2, is equal to: $(P_1 (1-P_1)/n_1) + (P_2 (1-P_2)/n_2)$--(where n_1 and n_2 are the sizes of the samples from which the estimates were made). The difference between two estimates, P_1-P_2, becomes significant when the difference is greater than 2 standard errors or less than -2 standard errors (when the absolute value of the difference is greater than 2 standard errors).

In the tables, the values of P_1 are found in the estimated percentage column. The values in the adjacent columns are the nearest values to P_1 which are significantly different from it; i.e., the closest values to P_1 where P_1-P_2 is greater than 2 standard errors.

TABLE A-5.--Significant differences for percentage values between U.S. and regions or States

Estimated percentage	Percentage value at which differences become significant	
	Upper	Lower
1	2.0	0.5
